SUN SAFETY AND SKIN CANCER

Prevention and early detection, saves lives.

Everything you need to know, to enjoy the sun safely and detect skin cancer early.

This booklet has been produced by national skin cancer awareness charity, Skcin: The Karen Clifford Skin Cancer Charity Registered Charity No: 1150048

SKIN CANCER
THE FACTS

Almost all skin cancers are caused by over-exposure to ultraviolet radiation (UVR). All skin types can be damaged by UVR, damage is permanent, irreversible, increases with each exposure and can result in death.

- Non-melanoma skin cancer is the UK’s most common cancer, with over 260,000 cases diagnosed annually.
- Over the last twenty-five years, rates of melanoma (the deadliest form of skin cancer) have risen faster than any other common cancer in Britain.
- According to Cancer Research UK, 1 in 36 UK males and 1 in 47 UK females will be diagnosed with melanoma skin cancer in their lifetime and it is now one of the biggest killing cancers in young adults (aged 15-34).
- Around 90% of all skin cancers are caused by damage from UVR, making the disease almost entirely preventable!

REMEMBER

By adopting simple sun safe practices skin cancer can be prevented and lives saved.

SOLAR UVR
THE FACTS

Solar ultraviolet radiation (UVR) is a known carcinogen, it cannot be seen or felt and is not related to temperature. It can pass through cloud, bounce off reflective surfaces and is the primary cause of skin cancer.

UVB rays reach the outer layer of the skin, (the epidermis) they are known as ‘burning rays’ and are the primary cause of sunburn and skin cancer.

UVA rays penetrate the middle layer of the skin, (the dermis) they contribute to skin damage and skin cancer and are also responsible for around 80% of the visible signs of ageing.

There’s no avoiding the fact that skin cancer is on the increase and it’s a killer. So, before you strip off and feel the warmth of the sun on your skin, whether on a beach abroad or simply enjoying a picnic or a bike ride in this country, ask yourself one question: Am I being sun safe, or am I dying to get a tan?

WARNING

UVA and UVB cause cumulative and irreparable damage to the skin cells which can lead to skin cancer.
WHEN IT COMES TO UV EXPOSURE THE MESSAGE IS CLEAR - THERE IS NO SAFE WAY TO GET A TAN!

WARNING

SUNBURN IS BAD NEWS AT ANY AGE AND THE DANGERS GO WAY BEYOND THE SHORT-TERM PAIN, SWELLING AND REDNESS. SUNBURN, PARTICULARLY IN CHILDHOOD OR ADOLESCENCE IS STRONGLY LINKED TO THE DEVELOPMENT OF MELANOMA IN LATER LIFE.

Even a single sunburn, can significantly increase a person’s risk of developing melanoma. Skin damage builds up over time starting with your very first sunburn - the more you burn, the greater your risk. This is because when the skin absorbs UV radiation, it can damage the genetic material in the skin cells, causing them to mutate, grow out-of-control and develop skin cancer.

Sunburn, reddening, peeling and even tanning of the skin is clear indication of sun damage. The simple fact that our skin changes colour is a warning sign that lets us know our body is working hard to defend itself from the harmful effects of the sun.

SUNBURN IS BAD NEWS AT ANY AGE AND THE DANGERS GO WAY BEYOND THE SHORT-TERM PAIN, SWELLING AND REDNESS. SUNBURN, PARTICULARLY IN CHILDHOOD OR ADOLESCENCE IS STRONGLY LINKED TO THE DEVELOPMENT OF MELANOMA IN LATER LIFE.

SUNBEDS ARE NOT A SAFE ALTERNATIVE TO SUN-BATHING. SUNBEDS EMIT THE SAME HARMFUL UV RAYS AS THE SUN, CAUSING DNA DAMAGE THAT INCREASES A PERSON’S RISK OF DEVELOPING DIFFERENT KINDS OF SKIN CANCER, INCLUDING THE MOST SERIOUS FORM MELANOMA.

There is so much evidence to support this, that the International Agency for Research on Cancer (IARC) has classified sunbeds as a Group 1 carcinogen. This is its highest cancer risk category. Reports further conclude that the risk of skin cancer is significantly higher when exposure takes place at a younger age.

Sunbeds use fluorescent bulbs that emit particularly high levels of UVA radiation at much greater intensities than natural sunlight to enable the skin to tan quickly. UVA radiation penetrates deep into the layers of the skin, significantly increasing the risk of cell damage and skin cancer. Once the tan fades the damage remains, which can result in very serious consequences over time.

WARNING

IN SOME COUNTRIES SUNBEDS ARE BANNED! IN THE UK, IT IS ILLEGAL TO USE SUNBEDS IF YOU ARE UNDER THE AGE OF 18.
GET THE CURRENT UV INDEX AND TWO DAY HOURLY FORECAST WITH SUN PROTECTION ADVICE AND HANDY REMINDERS!

THE SKCIN APP GIVES YOU INSTANT ACCESS TO THE UV INDEX FORECAST

1. SLIP on clothing - your first line of defence!
2. SLOP on SPF 30+, 4 or 5 star UVA sunscreen
3. SLAP on a broad brimmed hat
4. SLIDE on quality sunglasses
5. SHADE from the sun when possible

See overleaf for further detailed guidance.

© Copyright: Skcin 2021
1: SLIP on clothing - your first line of defence

- Clothing can be one of the most effective barriers between our skin and the sun.
- Clothing should cover as much skin as possible.
- Always keep shoulders covered, they can easily burn.
- A closer weave fabric will provide better protection.
- A high UPF rated fabric provides best protection.

2: SLOP on SPF 30+ sunscreen

- No sunscreen provides complete protection.
- Never rely on sunscreen alone to protect your skin.
- Always use a sunscreen with a Sun Protection Factor (SPF) 30 or above, preferably water resistant.
- Make sure it’s broad-spectrum and carries a UVA symbol (ideally rated 4 or 5 stars).
- Store in an accessible, cool place and remember to check the expiry date.
- Apply a generous amount to clean, dry, exposed skin.
- Apply 20 minutes before going outdoors and again once out to ensure adequate and even coverage.
- Regardless of the instructions all sunscreens should be reapplied AT LEAST every 2 hours (more often if perspiring) and always straight after swimming.
- Protect your lips with an SPF 30+ lip balm.

3: SLAP on a wide brimmed hat

- Wear a wide brimmed hat to protect the scalp and shade the face, neck, ears, cheeks and eyes.
- A close weave or UPF rated fabric provides best protection.
- Be aware that baseball caps do not provide adequate shade and extra measures should be taken to protect the back of the neck, ears and face.

4: SLIDE on quality sunglasses

- Solar UV radiation can be damaging to the eyes.
- Wear sunglasses that block 99 to 100 percent of both UVA and UVB rays, these should be marked with a rating CE UV400 or higher.
- Some sunglasses are labelled with an Eye Protection Factor (EPF) which ranges from 1-10. Those that carry an EPF of 9 or 10 provide excellent protection.
- Ensure your sunglasses are close fitting.
- A wrap around design will help prevent solar UVR entering the sides and top.
- Remember price and darkness of the lens have no reflection on the quality of protection.

5: SHADE from the sun when possible

- Shade can provide a good barrier from UV rays.
- Seek shade whenever possible, particularly during peak UV hours (between 11am and 3pm).
- Keep toddlers in the shade as much as possible and babies in the shade at all times.
- Never rely on shade alone, always combine with personal protection measures.

WHO IS MOST AT RISK OF SKIN CANCER?

All skin types can get skin cancer, however, those at greater risk tend to fall into one or more of the following categories:

- Red or fair hair with blue or green eyes
- Fairer skin types that burn and rarely tan
- Lots of moles and/or freckles
- A family history of skin cancer / melanoma
- A history of sunburn (particularly in childhood)
- A history of tanning and/or sunbed use
CHILDREN AND BABIES

A CHILD’S DELICATE SKIN IS HIGHLY SUSCEPTIBLE TO SUN DAMAGE. JUST ONE BLISTERING SUNBURN IN CHILDHOOD OR ADOLESCENCE MORE THAN DOUBLES A PERSON’S CHANCE OF DEVELOPING MELANOMA IN LATER LIFE.

• Cover children up with as much clothing as possible including a wide brimmed hat. UPF rated fabrics will provide optimum protection.
• Use a minimum SPF 30 sunscreen with 4 or 5 star UVA protection specifically formulated for children/babies.
• Apply liberally and evenly, ensuring good coverage.
• Apply 20 minutes before heading outdoors and reapply again once out to ensure adequate coverage.
• Reapply AT LEAST every 2 hours and immediately after swimming / towelling.
• Keep toddlers in the shade as much as possible and babies in the shade at all times!
• Don’t forget to ensure they are protected during school / pre-school hours and have access to their sunscreen and sun hat for use and reapplication throughout the day.

SKIN CANCER IN SKIN OF COLOUR

IT IS A COMMON MISCONCEPTION THAT PEOPLE WITH DARKER SKIN TONES ARE IMMUNE TO SKIN CANCER. INDIVIDUALS OF ALL SKIN TYPES CAN DEVELOP SKIN CANCER AND SHOULD CHECK THEIR SKIN MONTHLY FOR SIGNS OF CHANGE.

The term 'skin of colour' refers to diverse skin colours which includes people of Asian, African, Latino, Middle Eastern and Native American descent. Whilst melanoma is less common in people with these skin types, it is unfortunately often associated with greater morbidity and mortality because of the misconception that they are immune and the early signs and symptoms are often more difficult to detect.

When melanoma does occur, the most common places a tumour may develop include areas of lighter skin such as: the palms of the hands, soles of the feet and under the nails, the anogenital region (the area around the groin and anus) and the mucous membranes (inside the mouth for example).
SQUAMOUS CELL CARCINOMA (SCC)
• The majority occur on sun exposed areas such as the face, ears, lips, hands.
• Can present with varied appearance and grow at variable rates.
• Look for a hard, scaly, white or skin coloured lump, nodule or non-healing sore.
• SCC rarely spreads, but in extreme cases can become life-threatening.

BASAL CELL CARCINOMA (BCC)
• The most common type of non-melanoma skin cancer.
• The majority occur on sun exposed areas such as the face, neck and ears.
• Can appear in different shapes and sizes, are slow growing and rarely spread.
• Look out for pearly, shiny lumps, a skin ulcer, or patch of dry skin that won’t heal.
• In extreme cases, large or neglected BCC’s can cause extensive local invasion.

CHECKING YOUR SKIN
• Skin cancers seldom hurt and are much more frequently seen than felt.
• All skin types should check their skin thoroughly, once a month for the early warning signs.
• Undress completely, make sure you have good light, use a mirror and/or get someone to help you to check hard to see spots.
• Make sure you check your entire body - from the top of your head to the soles of your feet, including under your nails.
• Get to know your skin and every lump, bump, mole, freckle and mark, so that you feel confident in identifying any changes.
• If you spot anything NEW, UNUSUAL or CHANGING, seek immediate advice from a qualified health care practitioner.

THE SOONER SKIN CANCER IS IDENTIFIED AND TREATED, THE BETTER YOUR CHANCE OF AVOIDING SURGERY OR IN THE CASE OF MELANOMA, POTENTIAL DISFIGUREMENT OR EVEN DEATH. IF DETECTED AND TREATED EARLY, ALMOST ALL SKIN CANCERS, INCLUDING MELANOMA, ARE CURABLE.

EARLY DETECTION
IT IS IMPORTANT TO REGULARLY CHECK YOUR SKIN FOR SIGNS OF CHANGE TO DETECT CANCER EARLY. IT COULD SAVE YOUR LIFE!

NON-MELANOMA SKIN CANCER IS THE UK’S MOST COMMON CANCER WITH CASES EXPECTED TO REACH 400,000 ANNUALLY BY 2025.

NON-MELANOMA SKIN CANCER IS THE UK’S MOST COMMON CANCER WITH CASES EXPECTED TO REACH 400,000 ANNUALLY BY 2025.
DETECTING MELANOMA

- Melanoma is the most deadly form of skin cancer.
- Melanoma most commonly appear as a new mole (70%), or within an existing mole or freckle that changes in shape, size and/or colour.
- Left untreated, it can spread to form new cancers around the body.
- Melanoma can appear anywhere on the body, not just areas exposed to UV (on the soles of the feet, under nails or in the eye for example).

The ‘ABCDE OF MELANOMA’ is a common screening tool used to compare the characteristics of normal moles versus melanoma. These photographs show examples of melanoma to help you recognise abnormalities. However, not all melanoma look like these, only 70% follow the ABCDE rule and some may be very small - so it is very important to see your doctor if you notice any new, unusual, marks or changes that have lasted more than a few weeks. It is also important to check your skin regularly (once a month) for the early warning signs, especially if you are at higher risk of developing skin cancer.

CONSULT YOUR GP IMMEDIATELY IF YOU DEVELOP ANY OF THESE SIGNS:

- If a mole or freckle changes shape, particularly getting an irregular outline.
- If it changes colour/gets darker, becomes patchy or multi-shaded.
- If it gets bigger or a new spot, mark or mole is growing quickly.
- If it starts to itch, gets painful, starts bleeding, gets crusty or inflamed.
- Any skin, nail or mucosal (lips and genitalia) lesion that looks or is behaving differently to the rest of your moles / skin lesions.

THE ABCDE OF MELANOMA RULE:

A = ASYMMETRY: when one half of the mole doesn’t match the other.
B = BORDER: when the borders are irregular, ragged or blurred.
C = COLOUR: when the colour changes or varies throughout and/or there appears to be no uniform pigmentation.
D = DIAMETER: when the diameter is greater than 6mm (could be smaller).
E = EVOLVING: any changes to a mole’s appearance or sensation.

NODULAR MELANOMA AND THE EFG RULE:

- Nodular Melanoma look different to other melanoma.
- Grow quickly, are raised, more even in shape & colour.
- Many are black or red, but can be brown or pink.
- They are firm to touch and dome-shaped.
- Nodular melanoma can become quickly invasive - early detection is vital to improve prognosis.

NODULAR MELANOMA EFG RULE:

E = Elevated
F = Firm to touch
G = Growing
The Skcin App is a comprehensive, educational and self-management mobile application developed to empower users of all skin types to take charge of their skin health and surveillance. Prevention is better than cure and early detection saves lives - install the app today at: app.skcin.org

Learn all about ultraviolet radiation, how it affects your skin, how to take charge of your family’s skin health and prevent skin cancer by adopting simple sun safe strategies.

Get the current and daily peak UV index, 2 day hourly forecast and set alerts to know when the UVI reaches 3, when it reaches its daily peak and set 2 hourly sunscreen reminders.

Get rationale and advice with regards to your personal level of risk for the development of skin cancer and create multiple risk assessments for family members.

Learn about the various forms of pre-cancerous skin lesions, non-melanoma and melanoma skin cancers with images and detailed guidance on how to spot the early warning signs.

Your five-step guide to conducting thorough, full-body self examinations with the ability to set monthly reminders for when your next examinations are due.

Learn how to take action with concerns and ensure you receive appropriate action from your GP, in addition to overviews on diagnosis, staging and treatment.

Launching May 2022, track, store & compare changes to lesions with close-up photography and a comprehensive assessment and signposting service to help you take charge of concerns.
ABOUT SKCIN AND OUR MISSION

Skcin are a specialist skin cancer awareness charity founded in 2006 in memory of Karen Clifford (the ‘KC’ in Skcin). Our key objective is to fill the mammoth void that exists in the awareness arena, promoting prevention and early detection through educational intervention for public benefit.

Through the continual development of unique, sustainable, nationally accessible intervention initiatives, our mission is to reach as many people as possible with vital education to drive awareness, behavioural change and early diagnosis - empowering individuals of all and skin types to take charge of their skin health and surveillance.

Our vision is to save lives and combat statistics head on by preventing skin cancer for our future generations, improving patient outcomes through early diagnosis and relieving the significant burden of skin cancer on the NHS.

ABOUT SKCIN AND OUR MISSION

COMBATTING SKIN CANCER NATIONWIDE

Skcin have developed and operate a suite of six national accreditation programmes that target key ‘at risk’ and ‘influential’ audiences with bespoke educational intervention to help combat skin cancer on a national scale and save lives.

OUR ACCREDITATION PROGRAMMES

SUN SAFE SCHOOLS AND SUN SAFE NURSERIES: Two independent, national accreditation programmes providing primary and pre-school settings with comprehensive free resources to assist them in their duty of care to safeguard children against over-exposure to UV radiation and prevent skin cancer through education.

SUN SAFE WORKPLACES: A national accreditation programme that provides employers of outdoor workers with comprehensive resources to prevent occupational skin cancer and educate employees on the importance of prevention & early detection.

MASCED AND MASCED PRO TRAINING PROGRAMMES: Two independent accreditation programmes that are training eyes and saving lives across the hair and beauty industry and health care professions nationwide.

SKIN CANCER SOS: A national accreditation programme that works with businesses and organisations to deliver a bespoke disease prevention and health promotion programme for the benefit of their employee, member and client communities.
WAYS TO DONATE TO SKCIN AND SUPPORT US IN OUR MISSION TO COMBAT SKIN CANCER AND SAVE LIVES:

• Set up a fundraising page and/or donate any amount securely, on-line at: www.justgiving.com/skcin
• Send a cheque made payable to ‘SKCIN’ to: Skcin, 1a Mabel Grove, West Bridgford, Nottingham NG2 5GT

LEARN MORE AND TAKE CHARGE WITH THE SKCIN APP

A comprehensive, educational and self-management tool, empowering individuals of all skin types to take charge of their skin health and surveillance.

Simply go to: app.skcin.org and follow the on-screen instructions to install the app for free on your mobile device.
